## **Health Promotion Plan Presentation**

Good morning, everyone. We are glad partners have joined today's session. This session is about preventing Human Papillomavirus (HPV) infection in adolescents and young adults between the ages of 11 and 26, in Schwenksville, Pennsylvania. Today's presentation will provide information about HPV and its relation to cancer, its benefits to timely immunization, and strategies for talking to healthcare providers and family members about HPV vaccination. This presentation is guided by the SMART goals we developed as an agreement and the Healthy People 2030 objectives. We will now proceed to the presentation roadmap.

### **Presentation Roadmap**

Throughout the presentation, we will:

- Provide key facts about HPV, its transmission, and its link to cancer.
- Explain the importance, safety, and effectiveness of the HPV vaccine.
- Encourage participants to commit to scheduling the HPV vaccination within 30 days.
- Build participants' confidence in discussing the HPV vaccine with healthcare providers and family members.
- Engage participants through interactive activities and discussions.
- Evaluate participant knowledge and confidence through a brief post-session quiz and survey.

### **Key Information About HPV and Its Link to Cancer**

HPV is a very common virus that spreads from person to person through skin-to-skin contact, mainly through sexual activity. The statistics show that in Pennsylvania, only 68.7% of adolescents are fully vaccinated against HPV-related cancers. Specifically, these vaccination rates are low in rural areas (48.7%), like Schwenksville, with high

HPV-associated cancer incidence and mortality rates (PA.gov, 2025). Thus, vaccine awareness and implementation are crucial in Schwenksville.
